This application relates to application serial no. _____ (attorney docket number M-9086 US), filed on even date herewith, entitled "A Translation System for Configuration Data" and naming Theresa M. Gosko, and Joy Fang, as inventors, the application being incorporated herein by reference in its entirety.

BACKGROUND OF THE INVENTION

Field of the Invention

The present invention relates to automated order entry systems and more particularly to data structures for use in automated order entry systems.

Description of the Related Art

Electronic commerce, or e-commerce includes the transfer of orders or other sales communications, credit information, electronic "funds", and digital products. Electronic commerce provides speed and convenience to many types of commercial activities. Interest in electronic commerce has heightened with the advent of widely accessible communication systems such as the Internet. Other types of electronic commerce include direct telephone line connections, interactive cable or television services, facsimile services, local and wide area network communications and the like. Electronic data communications technologies, particularly the Internet, have greatly enhanced marketing and retail opportunities and activities.

Electronic commerce has not been fully realized. There is a need to incorporate electronic communications technologies to synchronize customer interactions with businesses. More specifically, electronic commerce capabilities need to be expanded to synchronize business relationships with customers. For example, present electronic commerce businesses do not provide customers with the capability of configuring non-commodity items such as services and configuration options that permit a customer to create a product and order the product so created. Additionally, electronic commerce presently fails to provide cohesive, integrated manufacturing processes that automate customer relationships.

5

10

SUMMARY OF THE INVENTION

In accordance with the present invention, data structures for transferring catalog and system order information between a manufacturer and a customer are shown. The data structures are configured to allow custom systems to be automatically ordered. These data structures advantageously allow a manufacturer and customer to electronically order systems, and specifically, non-commodity systems, quickly and easily.

More specifically, in one aspect the invention relates to a data structure for providing a catalog from a manufacturer to a customer. The catalog includes a catalog header portion, a system identification portion and a system type indicator. The system identification portion includes a system type indicator which indicates whether a system is a bundled system or a custom system.

In another aspect the invention relates to a data structure for acknowledging receipt a catalog by a customer to a manufacturer. The data structure includes an acknowledgement header portion and an acknowledgement detail portion. The acknowledgement header portion includes a reference identification element which references a catalog containing custom systems.

In another aspect the invention relates to a data structure for providing an order from a customer to a manufacturer using a catalog that includes custom systems. The data structure includes an order header portion, an order detail portion and an option detail portion. The order detail portion includes information about a specific configuration for the order. The option detail portion includes information allowing ordering of a custom system.

In another aspect the invention relates to a data structure for acknowledging receipt an order by a customer to a manufacturer. The data structure includes an acknowledgement header portion and an acknowledgement detail portion. The acknowledgement header portion includes a reference identification element referencing a custom order.

BRIEF DESCRIPTION OF THE DRAWINGS

The present invention may be better understood, and its numbers objects, features and advantages made apparent to those skilled in the art by referencing the accompanying

25

5

10

drawings. The use of the same reference number throughout the several figures designates a like or similar element.

FIG. 1 is a block diagram of a computer system in accordance with an embodiment of the invention.

FIG. 2 is a block diagram of a computer server network including a communication medium in accordance with an embodiment of the invention.

FIG. 3 is a block diagram of an automated order entry process in accordance with several embodiments of the invention.

Fig. 4 is a block diagram of the data structures of the automated order entry process of Fig. 3.

DETAILED DESCRIPTION

In the following description, for the purposes of explanation, numerous specific details are set forth in order to provide a thorough understanding of the present invention. It will be apparent, however, to a person of ordinary skill in the art that the present invention may be practiced without these specific details. In other instances, well-known structures and devices are shown in block diagram form in order to avoid unnecessarily obscuring the present invention.

Fig. 1 illustrates a block diagram of a computer system 100 upon which an embodiment of the present invention may be implemented. Computer system 100 includes a bus 101 or other communication mechanism for communicating information, and a processor 102 coupled to bus 101 for processing information. Computer system 100 further comprises a memory dynamic storage 104 coupled to bus 101 for storing information and instructions to be executed by processor 102. Computer system 100 also includes a read only memory (ROM) and/or other static storage device 106 coupled to bus 101 for storing static information and instructions for processor 102. A data storage device 107, such as a magnetic disk or optical disk, is coupled to bus 101 for storing information and instructions.

30

5

10

Computer system 100 may also be coupled via bus 101 to a display device 121, such as a cathode ray tube (CRT), for displaying information to a computer user. Optionally, computer system 100 operates as a computer server or as a computer system coupled to a computer server. An input device 122, including alphanumeric and other keys, is typically coupled to bus 101 for communicating information and command selections to processor 102. Another type of user input device is cursor control 123, such as a mouse, a trackball, or cursor direction keys for communicating direction information and command selections to processor 102 and for controlling cursor movement on display 121.

Referring now to Fig. 2, computer system 100 is shown coupled to communication medium 250, which may be a multi-point network, a point-to-point communications link, etc. any of type of circuit-style network link capable of transferring data. Communication medium 250 may be an X0.25 circuit, a physical type of line, such as a T1 or E1 line, or an electronic industry association (EIA) 232 (RS-232) serial line. In addition, communication medium 250 may utilize a fiber optic cable, twisted pair conductors, coaxial cable, or a wireless communication system, such as a microwave communication system. Coupled to communication medium 250 is database server 200, which, according to an embodiment of the present invention, provides data across communication medium 250 to a plurality of servers, shown as servers 252, 254, 256 and 258. In an embodiment of the invention, servers 252, 254, 256 and 258 each represent servers of a customer or a third party in communication with customers via communication medium 250. For example, server 258 is shown further coupled to customer server 260 and customer server 262.

OVERVIEW

The present invention is related to the use of computer systems and servers to facilitate and automate a manufacturing process, the process, hereinafter referred to as an Automated Order Entry (AoE) process, is outlined in Figure 3. Referring to Fig. 3, the manufacturing process is shown including communication with customers via the communication medium 250 and server 200. The AoE process first includes creation of a data file 310 for transport via the communication medium 250. The data file 310 includes an electronic catalog suited for one or more customers. The catalog allows customers (as well as suppliers or third parties) to host the data and configure both commodity and non-commodity products and services, as explained in further detail below. The term "customer"

30

5

10

or "customer hosted" includes third parties acting on behalf of a customer, supplier or manufacturer and hosting on behalf of the customer, supplier or manufacturer

Fig. 3 shows a data file 310 including an electronic catalog transmitted from server 200 to a customer server 254. The data file is in a structured data format which is one of a proprietary format (PFF), EDI (Electronic Data Interchange) format, an SGML (Structured General Markup Language), such as XML (eXtensible Markup Language) or HTML, or another format familiar to persons of ordinary skill in the art. Data file 310 is in an industry supported communication protocol. For example, the data optionally may be configured to be transferred via a "value added network type protocol," or be configured for a direct connection with a customer via a T1 line, such as a direct "pipe" line, or be configured for a TCP/IP protocol. The data file 310 is optionally first translated in translator 320 to an industry standard format, such as Electronic Data Interchange (EDI), or, if not translated, transmitted in a proprietary format to customer server 254. The customer server receives data file 310 and acknowledges non-commodity or commodity product in the data file 310 using acknowledgement file 336.

The AoE process continues on the customer server 254, wherein the data file enables the customer to host data file 310 and create orders, including internal purchase orders and files for transport to the manufacturer server 200. The customer transmits the order file 338 via communication medium 250 to manufacturer server 200. The order file 338 is optionally translated via translator 330 to an industry standard format prior to transmitting the order file 338 via the communication medium 250. The manufacturer receives either a proprietary file format or an industry standard format order file 338. If the order file 338 is in an industry standard format, the order file is first translated in translator 320. The manufacturer acknowledges the order file 338, process the order file 338, thereby validating the order via order acknowledgement file 340. Acknowledgement file 340 is transmitted via communication medium 250 to customer server 254, and is optionally translated into an industry standard format in translator 320, and translated into a proprietary file format by the customer in translator 330.

The AoE process further includes an inventory control process by which appropriate data feeds inventory control process 360. In one embodiment, the catalog acknowledgement file 336, indicates whether the data file including the electronic catalog 310 was 'accepted' by the customer. If accepted, the data file 310 is made available by AoE server 200 within

10

the AoE process to the inventory control process 360 to ensure appropriate inventory levels for products included in the electronic catalog that fall within a predetermined category of products. In another embodiment, the acknowledgement file 336 is not required to begin the inventory control process. For example, customers that lack the capability to send acknowledgment files. Such customers optionally may acknowledge and verify data files by other methods, such as a telephone call. Accordingly, in another embodiment, the inventory control process begins upon creation of the catalog or at other appropriate junctions within the manufacturing process. For example, certain catalogs include products that can be "bundled" as pre-built components, and other catalogs include products that are non-commodity type configurable products. Yet other catalogs include a mixture of both types of products. Each of these types of catalogs may be made available to the inventory control process.

Figure 4 sets forth the flow of data structures to a customer from a manufacturer and to the manufacturer from a customer. More specifically, a Catalog data structure 400 is generated by AoE server Database 200 in a PFF. The Catalog data structure is then translated from the PFF data structure to an industry standard format. This data structure is transmitted to the customer via transmission medium 250. The customer then acknowledges receipt of the Catalog with a Catalog Acknowledgement data structure 402. The Catalog Acknowledgement data structure 402 is translated from an industry standard format to a PFF via translator 320. If, for a particular customer, no acknowledgement is required, then the customer can proceed directly with ordering from the catalog after receipt of the catalog. In either case, the next step is the generation of an Order data structure 404 by the customer. The Order data structure is transmitted to the manufacturer using an industry standard format. The Order data structure is translated from the industry standard format to a PFF via translator 320. Once the Order data structure is processed, then the manufacturer may optionally generate and provide an Order Acknowledgement data structure 406 to the customer. It will be appreciated that additional variations on this flow may be used by those skilled in the art. For example, order cancel/change data structures and order cancel/change acknowledgement data structures may also be used in this flow.

30

25

DATA STRUCTURES AND TRANSLATIONS

The following data structures and translations show the operation of translator 320 as well as the data structures that are transmitted via communication medium 250.

More specifically, Table 1 sets forth the proprietary file format (PFF) data structure and translation to an EDI format for a Catalog data structure 400. In Table 1 (as well as throughout the other Tables), the EDI structures are set forth on the left and the corresponding PFF structure are set forth on the right. For example, the EDI structure BCT.01 corresponds to and is translated from the PFF structure Catalog Type, the EDI structure BCT.02 corresponds to and is translated from the PFF structure Catalog Version Number, etc. . . . Translator 320 performs the translation for each data structure that is provided to communication medium 250.

45

N/A

Trailer record (occurs once for each catalog file): Record tag: TRL

With the Catalog data structure 400, Catalog header data applies to the entire file. Bundle record structure has a system ID record followed by the system option records that make up that system and for each option, the part numbers that make up that option. The record type is "CF", and there are no "OP" record types for a Bundle system ID; the system type is "BNL". Additionally, Custom configurations have a system ID record that represents the default system ID prior to choosing options. This is referred to as a default system ID and is followed by the option records that make up that default system, the part numbers that make up that option. The system options record type is "CF", and configuration records are followed with additional record types of "OP" to denote the valid options that are available for that default configuration. The system type is "CUS".

Catalog data structure 400 includes a number of portions as well as elements within these portions. More specifically, the Catalog data structure 400 includes a Catalog Header portion, a System ID record portion, a System Option Record portion, a Part record portion and a Trailer portion. The Catalog header portion includes a number of data elements that apply to the entire Catalog. The System ID record portion is system specific for each configuration identifier. The System Option Record portion includes all of the component information for a specific system. The Part Record portion includes the skew level details for a specific system. The Trailer portion allows for an application program to validate that all records for a configuration/product are complete.

The System ID record portion includes a plurality of business rule elements that apply to a particular system. More specifically, the System ID element provides a manufacturer assigned unique identifier. The system ID Text description element provides the text describing the supplier assigned identification. The System ID Effective Date element provides the effective date that a particular configuration is allowed to be purchased. The System ID Action element programmably tells a customer what an action to perform. For example, an Add value adds a new product, a Replace value allows a price refresh where the same product is used but with a new price, a Discontinue value discontinues a product. The Replace System ID element is used with the System ID Action element indicates a Replace function. The Replace System ID refers to an old product number when a new product

25

30

5

10

5

10

number replaces the old product number. The Replace System ID element allows a customer to trigger any orders that have been started (within the customer's procurement system) to automatically update the pricing so that the whole ordering process does not have to be restarted. The System Type element tells a user whether a product is bundled, i.e., is a commodity item, or custom, i.e., is a non-commodity item. The System Discontinue Date element provides the date by which a system is discontinued. The System Discontinue Date element allows overlap of systems when discontinuing to flush out any pending (i.e., in process) orders. Alternately, the System Discontinue Date element may provide a hard drop date on which systems are discontinued.

The System Option Record portion includes a plurality of relationship indicator elements. More specifically, the Relationship id element provides an indicator that communicates for a component what the relationship of the component is with other components. For example, a PO (parent) value indicates that the component is a minisystem (or a solution), a CH (child) value indicates that the component is within a minisystem (i.e., is a child of the solution), a OR (orphan) value indicates that the component is optionally within a minisystem (i.e., is an orphan of the solution). The Record Type element determines whether the component is directly tied to a parent. I.e., the Record Type element shows whether an orphan is connected to the parent. The Option Indicator element shows what each component is (see, e.g., TABLE 2). The Option Legend Code element indicates the manufacturer code used to order a component as shown by the PFF. The Option Action Code element indicates that action that can be performed by a component.

Table 2 sets forth the option indicator values that are used by the data structure for the Option Indicator element of the Catalog data structure as well as other data structures of the AoE system. Providing a set of option indicator values allows a predefined cross-reference ability between the customer and the manufacturer, a customer to have a relationship and knowledge of what a non-commodity or commodity configuration includes.

Catalog acknowledgement data structure 402 includes a number of portions as well as elements within these portions. More specifically, the Catalog acknowledgement data structure 402 includes an Acknowledgement Header portion, an Acknowledgement Detail portion and a Trailer portion. The Acknowledgement Header portion includes a number of data elements that apply to the entire Acknowledgement. The Acknowledgement Detail portion includes a number of elements relating to the detail of the acknowledgement. The Trailer portion allows for an application program to validate that all records for an acknowledgement are complete.

The Acknowledgement Header portion includes a plurality of elements that enable acknowledgement of a commodity or non-commodity catalog. More specifically, the Reference ID element provides a reference to the catalog number from the Catalog data structure. The Acknowledgement Version Number element, the Acknowledgement Date element, the Acknowledgement Time element, and the Acknowledgement Time Code element all provide information relating to the acknowledgement of receipt of the catalog.

The Acknowledgement Detail portion includes a plurality of elements relating to the acknowledgement of receipt of the catalog. More specifically, the Application acknowledgement code element indicates whether each configuration in the catalog (commodity and non-commodity) is accepted or rejected. The Item reject text provides the reason why a configuration in the catalog is rejected.

Table 4 sets forth the PFF data structure and translation for the Order data structure 404.

Order data structure 404 includes a number of portions as well as elements within these portions. More specifically, the Order data structure 404 includes an Order Header portion, a Credit Card Payment portion, an Order Detail portion, an Option Detail portion, a Line Items Total portion and a Trailer portion. The Order Header portion provides a Header for each purchase order. The Credit Card Payment portion provides the information necessary for credit card payment. The Order Detail portion provides the specific configuration information for the order. The Option Detail portion provides the option details for the order. The Line Items Total portion provides detail used for confirming the line items of the order. The Trailer portion allows for an application program to validate that all records for an order are complete.

The Order Header portion includes a Planned Ship Code element that enables a customer to indicate that a ship date of less than or equal to a contracted lead time is desired. The element allows expedited handling to be requested while not causing an order to be rejected for being outside of a contract.

The Order Detail portion includes a System ID element which is the manufacturer quote number. When a system is a commodity system then the Order Detail portion includes

all the information necessary to complete the order. I.e., no Option Detail portion is necessary.

The Option Detail portion includes elements that enable a custom, non-commodity system to be ordered. Specifically, the Option Counter element provides a count of options being ordered. The Option Indicator element indicates the type of options being ordered (see, e.g., Table 2). The Option Quantity element indicates how many of each option are being ordered. The Option Action Code element indicates that action that is being used to include a particular option in the order.

Table 5 sets forth the PFF data structure and translation for the Order 10 Acknowledgement data structure 406.

		message)

Trailer record (occurs once for each Order Ack file):

Record tag: TRL

35 CTT.01 Total number of line items (number length 10).

Order acknowledgement data structure 406 includes a number of portions as well as elements within these portions. More specifically, the Order acknowledgement data structure 406 includes an Acknowledgement Header portion, an Acknowledgement Detail portion, an Acknowledgement Status portion and a Trailer portion. The Acknowledgement Header portion includes a number of data elements that apply to the entire Acknowledgement. The Acknowledgement Detail portion includes a number of elements that provide the detail of the

-19-

40

acknowledgement. The Acknowledgement status portion includes a number of elements that relate to the status of the acknowledgement, to acknowledge each option and system ID in an original order. The Trailer portion allows for an application program to validate that all records for an acknowledgement are complete.

5 Other embodiments

Other embodiments are within the following claims.

For example, while the preferred embodiment is set forth with reference to specific EDI transaction sets, other industry standard formats such as, but not limited to, XML or HTML are also within the scope of the invention.

Attachments A - D set forth the EDI transaction layouts that substantially conform to the ANSI EDI transaction sets 832, 824, 850, and 855, respectively. These transaction sets have been tailored from the ANSI industry standards to implement transaction sets that function with both commodity and non-commodity products.

Attachment A

832 Price/Sales Catalog

Functional Group ID=SC

Introduction:

This Standard contains the format and establishes the data contents of the Price/Sales Catalog 10 Transaction Set (832) for use within the context of an Electronic Data Interchange (EDI) environment. The transaction set can be used to provide for customary and established business and industry practice relative to furnishing or requesting the price of goods or services in the form of a catalog.

Purpose: Syntax Notes:

1

1 This segment, used alone, provides the most efficient method of providing organizational identification. To obtain this efficiency the "ID Code" (N104) must provide a key to the table maintained by the transaction processing party.

If either N103 or N104 is present, then the other is required.

2 N105 and N106 further define the type of entity in N101.

To identify a party by type of organization, name, and code

At least one of N102 or N103 is required.

824 Application Advice

5

Functional Group ID=AG

Introduction:

This Standard contains the format and establishes the data contents of the Application Advice 10 Transaction Set (824) for use within the context of an Electronic Data Interchange (EDI) environment. The transaction set can be used to provide the ability to report the results of an application system's data content edits of transaction sets. The results of editing transaction sets can be reported at the functional group and transaction set level, in either coded or freeform format. It is designed to accommodate the business need of reporting the acceptance, rejection or acceptance with change of any transaction set. The Application Advice should 15 not be used in place of a transaction set designed as a specific response to another transaction set (e.g., purchase order acknowledgment sent in response to a purchase order). 79520 744 754300

Notes:

This transaction is used to acknowledge receipt of a DELL 832 Sales Catalog.

Segment: OTI Original Transaction Identification

Position: 010

Loop: OTI Mandatory

Level: Detail
Usage: Mandatory

Max Use: 1

Semantic Notes:

5

10

30

35

Purpose: To identify the edited transaction set and the level at which the results

of the edit are reported, and to indicate the accepted, rejected, or

accepted-with-change edit result

Syntax Notes: 1 If OTI09 is present, then OTI08 is required.

1 OTI03 is the primary reference identification or number used to

uniquely identify the original transaction set.

2 OTI06 is the group date.

3 OTI07 is the group time.

4 If OTI11 is present, it will contain the version/release under which the original electronic transaction was translated by the receiver.

5 OTI12 is the purpose of the original transaction set, and is used to assist in its unique identification.

6 OTI13 is the type of the original transaction set, and is used to assist in its unique identification.

7 OTI14 is the application type of the original transaction set, and is used to assist in its unique identification.

8 OTI15 is the type of action indicated or requested by the original transaction set, and is used to assist in its unique identification.

9 OTI16 is the action requested by the original transaction set, and is used to assist in its unique identification.

10 OTI17 is the status reason of the original transaction set, and is used to assist in its unique identification.

1 OTI02 contains the qualifier identifying the business transaction from the original business application, and OTI03 will contain the

original business application identification.

2 If used, OTI04 through OTI08 will contain values from the original electronic functional group generated by the sender.

3 If used, OTI09 through OTI10 will contain values from the original electronic transaction set generated by the sender.

Notes: The OTI will occur once for EACH catalog System ID.

ATTACHMENT C

850 Purchase Order

5

Functional Group ID=PO

Introduction:

This Standard contains the format and establishes the data contents of the Purchase Order Transaction Set (850) for use within the context of an Electronic Data Interchange (EDI) environment. The transaction set can be used to provide for customary and established business and industry practice relative to the placement of purchase orders for goods and services. This transaction set should not be used to convey purchase order changes or purchase order acknowledgment information.

> **Purpose: Syntax Notes:**

1

To specify product subline detail item data

If either SLN04 or SLN05 is present, then the other is required.

If SLN07 is present, then SLN06 is required. 2 3 If SLN08 is present, then SLN06 is required.

4 If either SLN09 or SLN10 is present, then the other is required.

5 If either SLN11 or SLN12 is present, then the other is required.

If either SLN13 or SLN14 is present, then the other is required.

7 If either SLN15 or SLN16 is present, then the other is required.

8 If either SLN17 or SLN18 is present, then the other is required.

If either SLN19 or SLN20 is present, then the other is required.

10 If either SLN21 or SLN22 is present, then the other is required.

11 If either SLN23 or SLN24 is present, then the other is required.

12 If either SLN25 or SLN26 is present, then the other is required.

13 If either SLN27 or SLN28 is present, then the other is required.

Semantic Notes: SLN01 is the identifying number for the subline item.

30

25

35

-59-

- 2 SLN02 is the identifying number for the subline level. The subline level is analogous to the level code used in a bill of materials.
- 3 SLN03 is the configuration code indicating the relationship of the subline item to the baseline item.
- 4 SLN08 is a code indicating the relationship of the price or amount to the associated segment.

Comments:

- 1 See the Data Element Dictionary for a complete list of IDs.
- 2 SLN01 is related to (but not necessarily equivalent to) the baseline item number. Example: 1.1 or 1A might be used as a subline number to relate to baseline number 1.
- 3 SLN09 through SLN28 provide for ten different product/service IDs for each item. For example: Case, Color, Drawing No., U.P.C. No., ISBN No., Model No., or SKU.

Notes:

855 Purchase Order Acknowledgment

Introduction:

5

30

This Standard contains the format and establishes the data contents of the Purchase Order

Acknowledgment Transaction Set (855) for use within the context of an Electronic Data
Interchange (EDI) environment. The transaction set can be used to provide for customary and
established business and industry practice relative to a seller's acknowledgment of a buyer's
purchase order. This transaction set can also be used as notification of a vendor generated
order. This usage advises a buyer that a vendor has or will ship merchandise as prearranged
in their partnership.

Transaction Set Notes

1. PO102 is required.

5

- The number of line items (CTT01) is the accumulation of the number of PO1 segments. 2. If used, hash total (CTT02) is the sum of the value of quantities ordered (PO102) for each PO1 segment.
- If AMT is used in the summary area, then AMT01 will = TT and AMT02 will indicate 3. total transaction amount as calculated by the sender.
